

TDA7309

DIGITAL CONTROLLED STEREO AUDIO PROCESSOR WITH LOUDNESS

1 FEATURES

- INPUT MULTIPLEXER:
3 STEREO INPUTS
- RECORD OUTPUT FUNCTION
- LOUDNESS FUNCTION
- VOLUME CONTROL IN 1dB STEPS
- INDEPENDENT LEFT AND RIGHT VOLUME CONTROL
- SOFT MUTE FUNCTION
- ALL FUNCTIONS PROGRAMMABLE VIA SERIAL I²C BUS

Figure 1. Packages

Table 1. Order Codes

Part Number	Package
TDA7309	DIP20
TDA7309D	SO20
TDA7309D013TR	Tape & Reel

2 DESCRIPTION

The TDA7309 is a control processor with independent left and right volume control for quality audio applications. Selectable external loudness and soft mute functions are provided.

Control is accomplished by serial I²C bus micro-processor interface.

The AC signal setting is obtained by resistor networks and switches combined with operational amplifiers.

Thanks to the used BIPOLAR/CMOS Technology, Low Distortion, Low Noise and Low DC stepping are obtained.

3 I²C BUS INTERFACE

Data transmission from microprocessor to the TDA7313 and viceversa takes place thru the 2 wires I²C BUS interface, consisting of the two lines SDA and SCL (pull-up resistors to positive supply voltage must be connected).

3.1 Data Validity

As shown in fig. 11, the data on the SDA line must be stable during the high period of the clock. The HIGH and LOW state of the data line can only change when the clock signal on the SCL line is LOW.

3.2 Start and Stop Conditions

As shown in fig. 16 a start condition is a HIGH to LOW transition of the SDA line while SCL is HIGH. The stop condition is a LOW to HIGH transition of the SDA line while SCL is HIGH.

3.3 Byte Format

Every byte transferred on the SDA line must contain 8 bits. Each byte must be followed by an acknowledge bit. The MSB is transferred first.

3.4 Acknowledge

The master (μ P) puts a resistive HIGH level on the SDA line during the acknowledge clock pulse (see fig. 17). The peripheral (audioprocessor) that acknowledges has to pull-down (LOW) the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during this clock pulse.

The audioprocessor which has been addressed has to generate an acknowledge after the reception of each byte, otherwise the SDA line remains at the HIGH level during the ninth clock pulse time. In this case the master transmitter can generate the STOP information in order to abort the transfer.

3.5 Transmission without Acknowledge

Avoiding to detect the acknowledge of the audioprocessor, the μ P can use a simpler transmission: simply it waits one clock without checking the slave acknowledging, and sends the new data. This approach of course is less protected from misworking and decreases the noise immunity.

Figure 15. Data Validity on the I²C BUS

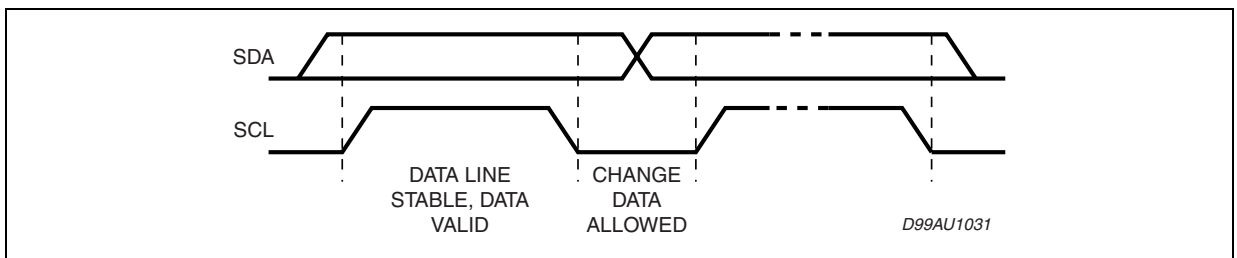

Figure 16. Timing Diagram of I²C BUS

Figure 17. Acknowledge on the I²CBUS

Table 6. SDA, SCL I²CBUS Timing

Symbol	Parameter	Min.	Typ.	Max.	Unit
f _{SCL}	SCL clock frequency	0		400	kHz
t _{BUF}	Bus free time between a STOP and START condition	1.3			μs
t _{HD:STA}	Hold time (repeated) START condition. After this period, the first clock pulse is generated	0.6			μs
t _{LOW}	LOW period of the SCL clock	1.3			μs
t _{HIGH}	HIGH period of the SCL clock	0.6			μs
t _{SU:STA}	Set-up time for a repeated START condition	0.6			μs
t _{HD:DA}	Data hold time	0.300			μs
t _{SU:DAT}	Data set-up time	100			ns
t _R	Rise time of both SDA and SCL signals	20		300	ns (*)
t _F	Fall time of both SDA and SCL signals	20		300	ns (*)
t _{SU:STO}	Set-up time for STOP condition	0.6			μs

All values referred to VIH min. and VIL max. levels
 (*) Must be guaranteed by the I²C BUS master.

Figure 18. Definition of Timing on the I²C-bus

4 SOFTWARE SPECIFICATION

4.1 Interface Protocol

The interface protocol comprises:

- A start condition (S)
- A chip address byte, containing the TDA7309 address (the 8th bit of the byte must be 0).
The TDA7309 must always acknowledge at the end of each transmitted byte.
- A sequence of data (N-bytes + acknowledge)
- A stop condition (P)
